

# Content Critique

## [Quiz Instructions](#)

Please take the next 5-10 minutes to answer the following questions in one or two sentences each. Think generally about what a beginner beekeeper should understand and the concepts of 'brain processing' and 'expert blind spot'.

## [Questions](#)

Consider the two ways our brains process information:

System 1 - Fast thinking based on past experience and predictions

System 2 - Slow thinking based on deliberate processing of complex information

Now think about a lesson that you teach at Bee School:

Where do you use 'Fast Thinking'?

Is there an area where you could "slow down" the content and explain it better through a beginner's eyes?

How could you adapt the content of your lesson to better help a beginner absorb the most important information?

Is there information that could be omitted that might help simplify the lesson, and better emphasize the most critical parts for a beginner to understand?

How could you adapt the presentation of the material to better help a beginner to absorb the most important information?

How could you better apply your teaching strengths to help a beginner understand the most important information?
